Introduction

Kafe D'Rimba Database System

- Kafe D'Rimba is a café located within the University of Malaya
- Serves students and staff with dine-in and takeaway services
- Orders and payments are currently handled manually at the counter
- Sales records and order tracking rely on paper and WhatsApp

Objectives

- Digitize and centralize café operations
- Improve accuracy and efficiency of order handling
- Manage menu items and availability effectively
- Store staff information and track staff involvement in orders
- Record payment details for accurate financial tracking
- Generate daily sales reports and identify popular menu items

Challenges Faced

01. Difficulty collecting data due to delayed responses from organizations

Several organizations did not respond to interview requests, which delayed requirement gathering until Kafe D'Rimba agreed to participate.

02. Converting real café operations into a structured database design

Translating daily ordering, payment, and staff workflows into proper database entities and relationships required careful analysis.

03. Handling many-to-many relationships using the ORDERDETAIL table

Orders can contain multiple menu items, and menu items can appear in multiple orders, which required a bridge table to store order details correctly.

04. Working with Oracle SQL syntax and managing database constraints

Defining primary keys, foreign keys, and constraints required attention to Oracle-specific syntax to avoid errors and maintain data integrity.

Thank you!
